

## **EPLAMID 6 GFR 35 NC Q2D501**

#### Polyamide 6

### **Technical Data Sheet**

Material Information: Polyamide 6, reinforced with 35% of glass fiber, heat-aging stabilized, lubricated for injection

Notes: Eplamid 6 glass fiber reinforced compounds are used in all sectors of industry, offering a good balance of thermal and mechanical properties.

This material is available in black and colours on request.

Properties	<b>Test Method</b>	Unit		Value
Physical properties			Dry	Cond
Density (23°C)	ISO 1183	g/cm <sup>3</sup>	1,40	
Humidity absorption (equilibrium)	ISO 62	%	1,9	
Water absorption(saturation)	ISO 62	%	6,2	
Mold shrinkage- parallel/normal (2mm)	ISO 294-4	%	0,4/0,6	
Mechanical properties				
Tensile modulus (1mm/min) (23°C)	ISO 527-2	MPa	11800	8800
Tensile stress at break (5mm/min) (23°C)	ISO 527-2	MPa	195	135
Tensile strain at break (5mm/min) (23°C)	ISO 527-2	%	3	5
Flexural modulus (2mm/min) (23°C)	ISO 178	MPa	10500	8000
Flexural strength (2mm/min) (23°C)	ISO 178	MPa	300	240
Notched izod impact (23°C)	ISO 180/1A	kJ/m²	16	18
Unnotched izod impact (23°C)	ISO 180/1U	kJ/m²	95	105
Notched charpy impact (23°C)	ISO 179/1eA	kJ/m²	17	19
Unnotched charpy impact (23°C)	ISO 179/1eU	kJ/m²	100	110
Thermal properties				
Melting point (10°K/min)	ISO 11357/1-/3	°C	220	
Temp. of deflection under load (0,45 MPa)	ISO 75-2/B	°C	215	
Temp. of deflection under load (1,80 MPa)	ISO 75-2/A	°C	210	
Flammability & electrical properties				
Flammability classification (0,8mm) - UL 94	EN 60695-11-10	-	НВ	
Comparative tracking index - CTI (Solution A)	EN 60112	V	500	
Surface resistivity	ASTM D257	$\Omega$ /sq	1,00E+13	

## Test conditions

Laboratory conditions are 23 ±2°C and 45-55 % RH.

## **EPLAMID 6 GFR 35 NC Q2D501**

### Polyamide 6

#### **EPLAMID 6 GRADES PROCESSING CONDITIONS**

### **Injection moulding of EPLAMID 6**

Polyamide 6 is easy to mould material, with a very wide processing window.

A few general guidelines are given here.

#### **Pre-drying**

Polyamide is hygroscopic and moisture sensitive, so pre-drying is recommended as a matter of rule. Material that is not pre-dried to a moisture level below 0,1 % will degrade, causing surface defects, parts that are out of dimension and brittle parts. It is recommended to dry material for 4 hours at  $80^{\circ}$ C to  $85^{\circ}$ C in a desiccant dryer with more than one desiccant element.

A few tips to ensure proper operation of the dryer:

- \* Ensure the thermocouple that regulates the temperature is placed immediately before the entry of the air into the dryer. There can be a significant temperature drop in the air-conveyance system.
- \* The temperature of the air going out of the dryer silo should not be more than 30°C lower than the air entering the system. If this is the case, you have insufficient air capacity.
- \* From time to time, monitor the dew point of the dry air to ensure the desiccant elements are functioning properly.
- \* Often, less air runs through the very bottom part of a dryer silo. Therefore, it is recommended that you take the material out of the bottom of the dryer and feed back into the top when you start up your process.

### **Moulding temperatures**

Polyamide 6 can be processed between 220 and 295°C, depending on the grade used.

The following barrel settings are recommended:

Material	Zone 1 (Hopper)	Zone 2	Zone 3	Zone 4 (Nozzle)
Unfilled Grades	220-260°C	225-270°C	225-270°C	225-275°C
Impact M. Grades	220-265°C	225-260°C	225-265°C	230-275°C
Flame Ret. Grades	225-260°C	230-260°C	235-265°C	235-265°C
Reinforced Grades	240-280°C	240-290°C	240-290°C	240-295°C

#### **Tool temperature**

Mould temperature is always a compromise. Moreover, tool temperature should be as a high as possible to give optimum crystallization, dimensional, good surface finish and excellent mechanical performance. On the other hand, lower tool temperature can significantly cut cycle time.

For Polyamide 6,  $60^{\circ}\text{C-}80^{\circ}\text{C}$  should be the standard range. For highly reinforced grades values of up to  $110^{\circ}\text{C}$  are preferred.

#### **Pressure and speed**

Injection pressure should generally be around 70 to 120 Mpa; this results in a minimum clamping force of the moulding machine in tonnes of 0,7 times the projected surface area in cm<sup>2</sup>.

Holding pressure is generally in the area of 90 Mpa.

For glassfibre reinforced compounds, the screw speed should be kept low, a rough indication is as follows:

Screw diameter (mm)	Maximum rpm	
20	150	
30	100	
40	70	
50	60	
60	50	
70	40	
80	35	
>80	30	

Back pressure should be kept to a practical minimum.

# **Use of regrind**

Regrind sprues and runners can be used on most materials. It is not recommended to use regrind on FR grades. When regrind is used, observe these simple rules:

- \* Use a constant ratio of regrind and virgin material. When a material has been processed once, its viscosity and fibre length have been decreased. Using varying rations of regrind can lead to variations in dimensions, mechanical performance and processing characteristics.
- \* Either feed the regrind straight back into the machine or pre-dry the regrind before usage.
- \* Store regrind in a dry, clean place to avoid contamination and excess moisture.
- \* Ensure sharp cutting blades to keep dust generation to a minimum; cut glass fibre reinforced material when it is still hot.
- \* Clean the grinder regularly to avoid build up of dust.
- \* Do not use splayed, discoloured or degraded parts and runners.
